Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Thu 10/02/2022 TO 18:00HRS Fri 11/02/2022

THE AVALANCHE HAZARD WILL BE MODERATE

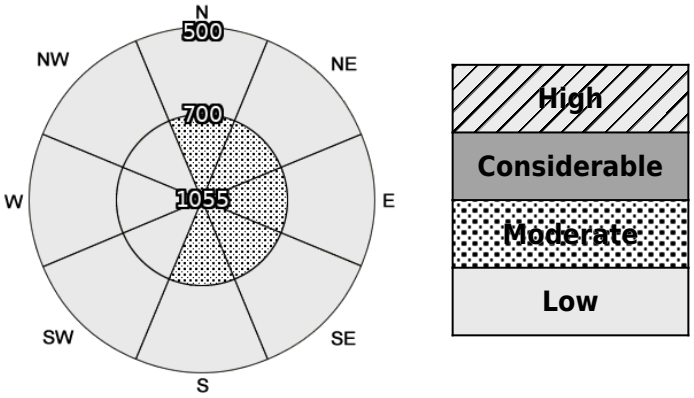
Avalanche Hazard Forecast for Friday 11/02/2022

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

New moderately bonded windslab will add to existing localised areas of unstable windslab on North through East to South aspects mainly above 700m. Areas most affected will be wind sheltered locations such as corrie rims, gully exits, crag aprons and the leeward side of ridge crests. Below 700m and on windward aspects the remaining snowpack is expected to be firm and generally stable. The avalanche hazard will be Moderate.



Forecast Weather Influences

Lighter overnight Northerly winds will back through South-West to South during daylight hours increasing to gale force on the summits by the end of the day. Occasional wintery showers are expected during the day. The freezing level will gradually rise from 200m to around 550m by the end of the forecast period.

Comments

The freezing level is dropping to around glen level this evening. Much drier, colder and less windy day in prospect for tomorrow.
