Avalanche Hazard Forecast

Issued 29/01/2022

FOR PERIOD 18:00HRS Sat 29/01/2022 TO 18:00HRS Sun 30/01/2022

THE AVALANCHE HAZARD WILL BE LOW

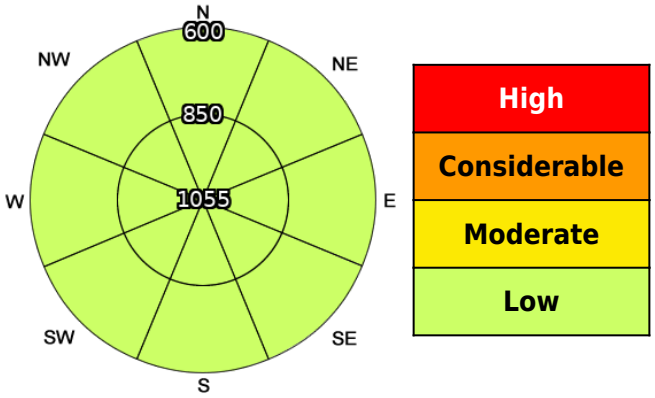
Avalanche Hazard Forecast for Sunday 30/01/2022

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

The depleted and very patchy snowpack will firm up overnight in the cooler temperatures and remain generally stable. By late afternoon as the snow showers arrive, drifting can be expected and new snow will form shallow accumulations on wind sheltered coire rims, ridge flanks and the tops of gullies on North-West to North-East aspects above 850 metres. Much of these new deposits will lay on bare ground. The avalanche hazard will be Low.



Forecast Weather Influences

The strong to gale force West-North-West winds will recede in strength to moderate South-Westerly overnight, then gradually increase in strength to become strong to gale force Southerly. It will be a dry night and it will remain dry until well into tomorrow morning. By late morning heavy snow showers are expected for the remainder of the period. The freezing level will be at 500 meters and rise to around 850 meters by tomorrow late afternoon.

Comments

A blustery, wild and windy day as storm Malik clears away. More snow expected as the next storm cycle approaches.
