Avalanche Hazard Forecast

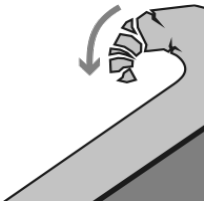
FOR PERIOD 18:00HRS Wed 27/12/2023 TO 18:00HRS Thu 28/12/2023

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Thursday 28/12/2023

Avalanche Problems

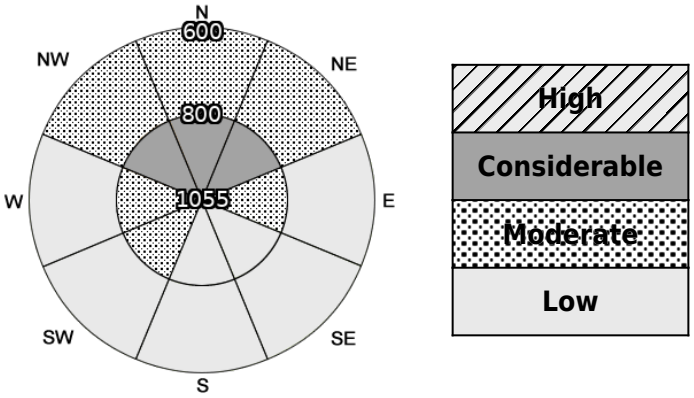
Wind Slab



Cornices

Forecast Snow Stability & Avalanche Hazard

Weaknesses will persist in the deep accumulations of windslab that remain mostly above 800m on W through N to NE aspects. Additionally, new snow with redistributed deposits will form new windslab on North-West to North-Easterly aspects above 800m. Coire back walls and rims, gully tops and ridge flanks most affected. Below this level, stability will generally improve, some weaknesses may linger in deeper deposits above 600m on same aspects. Weak Cornices. The avalanche hazard will be Considerable



Forecast Weather Influences

Freezing levels will be around 8-900 metres throughout the period. Winds will be very strong South-Westerly overnight, lessening in strength during the afternoon to fresh. Precipitation will be continual during the forecast period falling as persistent snow or sleet showers at summit levels, rain below mostly 600 metres.
