Avalanche Hazard Forecast

Issued 02/01/2024

FOR PERIOD 18:00HRS Tue 02/01/2024 TO 18:00HRS Wed 03/01/2024

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Wednesday 03/01/2024

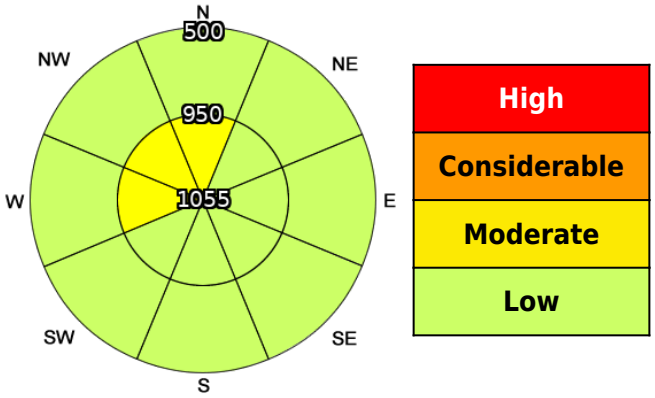
Avalanche Problems

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Localised areas of unstable windslab will continue to build throughout the period, affecting wind sheltered locations at summit levels above 950 metres on steep West to North aspects. Terrain features most affected will be higher coire rims, gully tops and ridge flanks. Fragile cornices will develop above the same locations. Elsewhere, the existing shallow snowpack will be thawing and consolidating. The avalanche hazard will be Moderate.



Forecast Weather Influences

Showers or longer periods of light rain and summit snow are expected throughout the period, but mostly during the day. There will be a persistent strong, generally South-East wind throughout. The freezing level will be maintained around the higher summits.

Comments

Remaining unsettled, although becoming drier and freezing levels slowly falling by Friday.
