Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Mon 11/03/2024 TO 18:00HRS Tue 12/03/2024

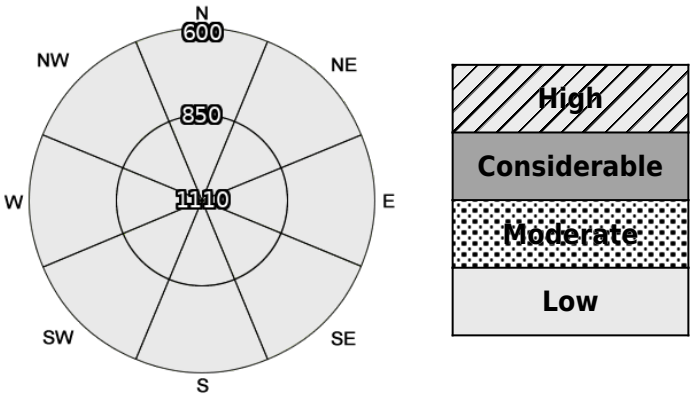
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 12/03/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change is expected to the snowpack which will remain firm and stable throughout. However, some surface softening of the snow is likely through the day. Most snow will exist on the more inland mountains on high North to East aspects, particularly around coire rims, in gully lines and on some summit slopes. Coastal ranges will largely be bare. The avalanche hazard will be Low.



Forecast Weather Influences

A small amount of summit sleet and snow will fizzle out this evening, turning largely dry overnight. Some light rain and drizzle at all levels is expected from late morning onwards as the freezing level rises well above the summits by daybreak. A strengthening, generally South-East wind will become fresh to strong by midday.

Comments

Diminishing snowpack, but significant areas of snow remain above 800m on the inland mountains. The snowpack will start to surface soften through the day, but will remain generally firm, particularly at summit levels.
