Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Wed 24/01/2024 TO 18:00HRS Thu 25/01/2024

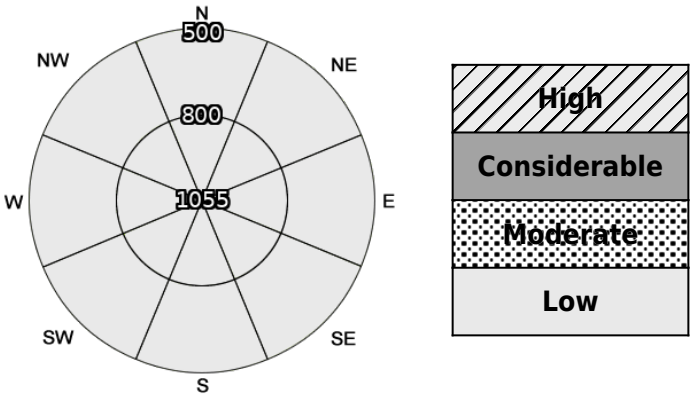
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 25/01/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The generally wet and thawing snowpack will remain stable in all locations and aspects, becoming firmer overnight at summit level, before thawing again later. Any new snow on the highest summits will be insignificant and short lived. Remaining cornices will be small and generally well consolidated. Depleted snow cover overall and patchy below 700 metres. The avalanche hazard will be Low.



Forecast Weather Influences

Largely dry overnight before rain arrives mid morning with a little sleet and snow possible above 900 metres initially. The fresh to strong Westerly wind will back Southerly overnight, strengthening to gale force for a time in the afternoon. The freezing level will hover around 950 metres before rising well above the summits by mid morning.

Comments

Another freeze-thaw cycle expected at summit level. Further consolidation of the snowpack, but a generally diminishing trend, not helped by gales and rain tomorrow afternoon.
