Avalanche Hazard Forecast

Issued 06/02/2024

FOR PERIOD 18:00HRS Tue 06/02/2024 TO 18:00HRS Wed 07/02/2024

THE AVALANCHE HAZARD WILL BE MODERATE

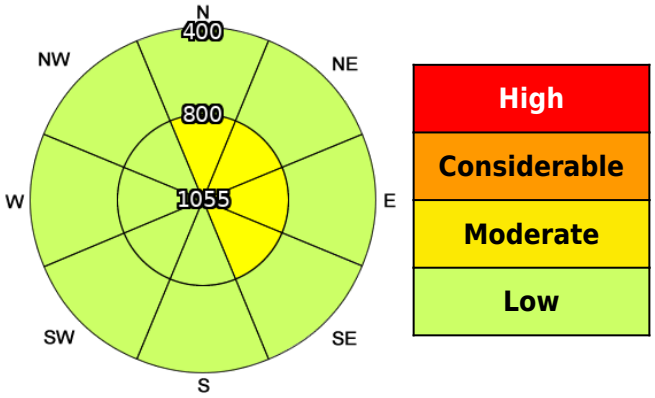
Avalanche Hazard Forecast for Wednesday 07/02/2024

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

The old snowpack remnants above 800 metres will be frozen icy and stable. New accumulations of snow will continue to gradually build on Northerly through East to South-Easterly aspects. This will lie as a dusting on slopes at all levels but will only be of significance at higher elevations above 800 metres where it gains depth. Locations where deeper accumulations of windslab will be likely, will be in wind sheltered hollows, coire rims and gully tops. The avalanche hazard will be Moderate



Forecast Weather Influences

Winds will be fresh to strong generally South-Westerly veering North-Westerly during the forecast period. Snow showers will continue, heaviest overnight, then light during the day. Colder with a freezing level around 300 to 200 metres throughout the period.

Comments

Remaining cold with a dusting of snow on the tops with a gradually increasing cover. Old snow hard and icy with serious consequences for an trips or falls.
