Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Thu 08/02/2024 TO 18:00HRS Fri 09/02/2024

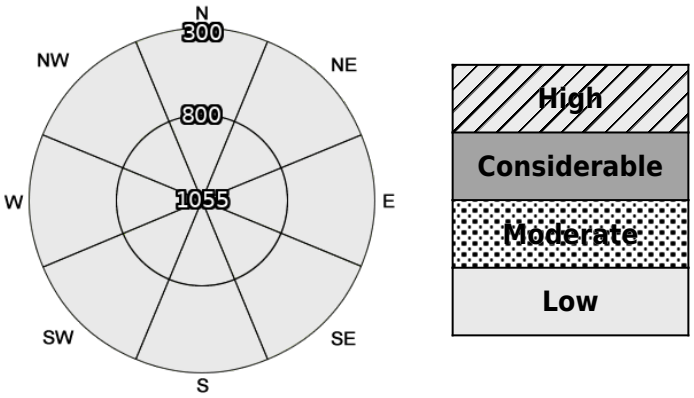
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 09/02/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The overall snow cover will remain shallow and generally stable throughout. However, due to redistribution of existing snow, isolated accumulations of fresh windslab will exist on steep sheltered SW to NW aspects largely above 750 metres. Wind sheltered ridge flanks, coire rims and gully tops will be affected, but will mostly be avoidable. Exposed remnants of old snow will be frozen and very firm. The avalanche hazard will be Low.



Forecast Weather Influences

It will be a largely dry and very windy day, with the possibility of light snowfall on the more inland mountains. Easterly gales or severe gales will persist throughout the period. There will be a frost in the glen initially, freezing level rising to around 300 metres in the afternoon.

Comments

The wind tomorrow could reach storm force on exposed summits due to a strong inversion above the peaks.
