Avalanche Hazard Forecast

**Issued 23/12/2021**

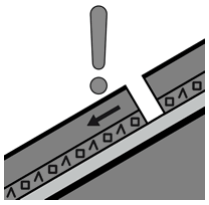
FOR PERIOD 18:00HRS Thu 23/12/2021 TO 18:00HRS Fri 24/12/2021

## THE AVALANCHE HAZARD WILL BE LOW

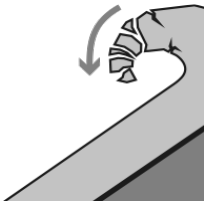
### Avalanche Hazard Forecast for Friday 24/12/2021

#### Avalanche Problems

**Wind Slab**



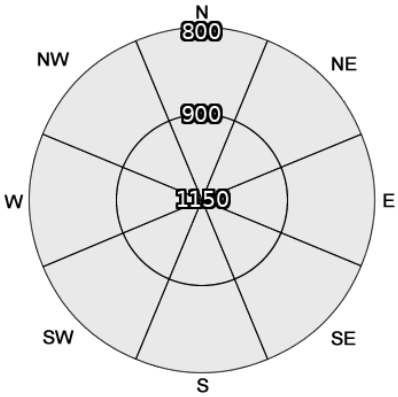
**Persistent Weak Layers**

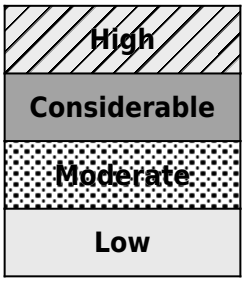


**Cornices**

#### Forecast Snow Stability & Avalanche Hazard

The existing snowpack will re-freeze overnight giving good general stability. New snow and Easterly winds will form isolated areas of unstable windslab on sheltered slopes mainly with a West through to Northerly aspect above 900 metres. These areas are expected to be of a localised nature mainly restricted to sheltered corrie rims and summit gullies where old snow underlies. Fresh cornices will be fragile. The avalanche hazard will be Low.





#### Forecast Weather Influences

Rain, sleet and snow will affect all levels overnight becoming drier through the morning. New snow amounts are not expected to be great. Becoming colder through the day as freezing level lowers to around 400 metres. Easterly winds initially fresh becoming strong later in the day.

#### Comments

Becoming drier and colder through the day.
