Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Sat 16/03/2024 TO 18:00HRS Sun 17/03/2024

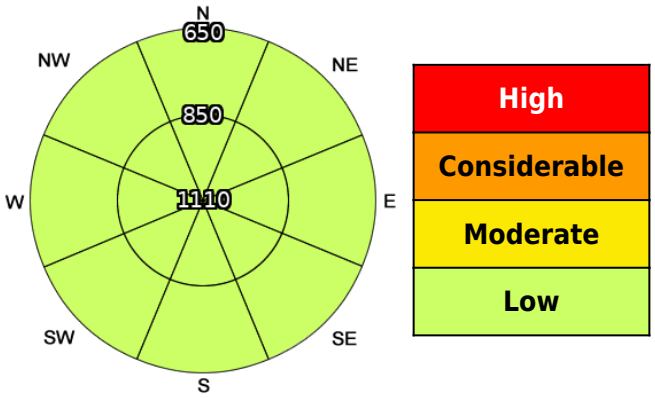
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Sunday 17/03/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Generally good stability throughout the period with a consolidation trend at all levels in the expected slow thaw conditions. The most recent shallow snow cover will be soft and moist, with deeper drifts on South to West aspects, mainly above 850 metres. The old snowpack will remain firm and well bonded, mainly lying on high North to East aspects, predominantly on the more inland mountains. The avalanche hazard will be Low.



Forecast Weather Influences

After some light rain, sleet and snow at summit level this evening, it will be a largely dry and mild day. The freezing level will remain above the summits, peaking at plus 4C at 1000 metres mid afternoon. The strong South-East wind will gradually moderate through the period, veering South overnight.

Comments

Through Sunday until Monday evening, it will be mainly dry, with a few showers possible, Remaining mild for this time of year.
