Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Mon 25/03/2024 TO 18:00HRS Tue 26/03/2024

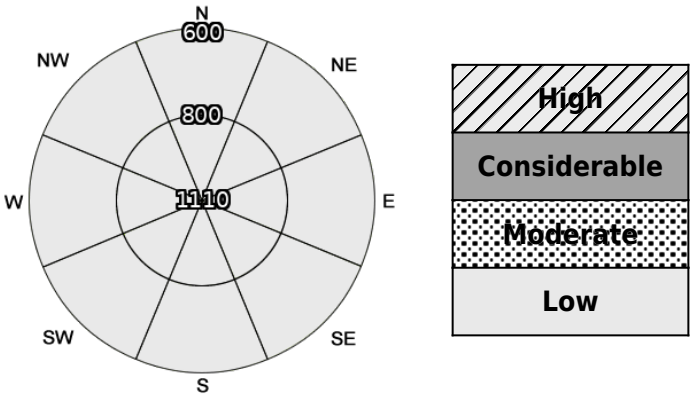
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 26/03/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The lightest dusting of new snow is likely, most obvious on the more inland peaks above 600 metres. The existing shallow snowpack will continue to consolidate and will have good stability throughout. Greatest accumulations of snow will remain on East to South aspects, above 800 metres, round coire rims, on ridge flanks and in tops of gullies. Exposed patches of old snow will be very firm and icy in places. The avalanche hazard will be Low.



Forecast Weather Influences

Expect some drizzly snow flurries at times, especially on the more inland mountains. Otherwise, largely dry. The fresh to strong North-East to East wind will moderate overnight, strengthening again through the day. The diurnal air temperature at high summit level will range from -5C overnight to -3C in the afternoon.

Comments

Although the NW Highlands will escape the worst of the weather, some light snowfall is likely to drift westward at times. Remaining cold tomorrow, with significant windchill at summit level.
