Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Thu 28/03/2024 TO 18:00HRS Fri 29/03/2024

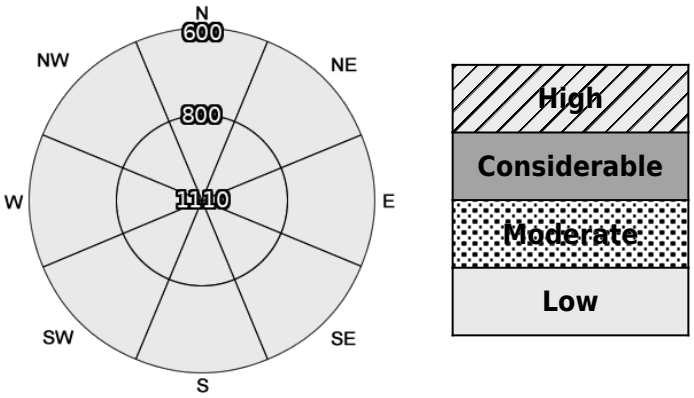
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 29/03/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The existing shallow snowpack will be well bonded, firm and stable. Any new summit snow amounts are not expected to be significant. The remaining snow cover will continue to gradually diminish at most levels with greatest amounts remaining above 800 metres on East to South aspects, particularly in gullies, around coire rims and on ridge flanks. The avalanche hazard will be Low



Forecast Weather Influences

Light scattered showers through the period will be rain at most levels with some summit snow. The freezing level will drop to 900 metres by dawn and rise to around 1000 metres by the end of the day. Very strong Easterly winds overnight will decrease to light by dawn and become moderate South-South-Westerly most of the day.

Comments

Despite diminishing cover, the snow surface will remain firm in many locations, with run outs onto rocks below steep slopes.
