Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Mon 01/04/2024 TO 18:00HRS Tue 02/04/2024

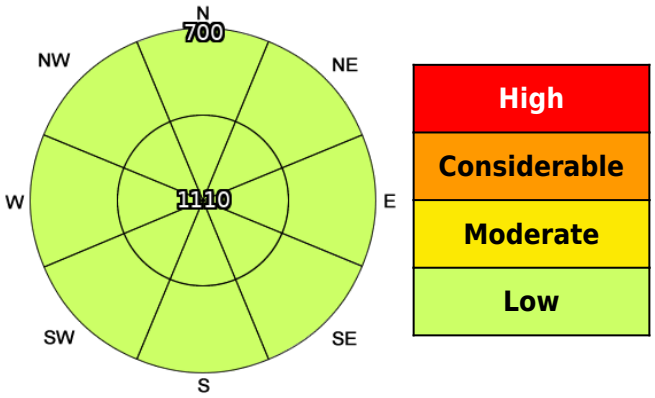
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 02/04/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change expected. The limited snow cover will be stable in all locations and will continue to slowly diminish. The snow will generally be soft, but firmer on the highest summits and on high shaded Northerly aspects. Most snow remains above 800 metres on North to South-East aspects and mainly on the inland mountains. The avalanche hazard will be Low.



Forecast Weather Influences

A mainly dry period, but with the possibility of a little summit drizzle through the day, falling as sleet or snow on the highest tops. Expect a persistent fresh to strong East-North-East wind. Freezing level around 800 to 900 metres.

Comments

Remaining unsettled, but with an Easterly airflow persisting, there is likely to be less precipitation in the North-West than mountains further inland exposed to the East wind.
