

THE AVALANCHE HAZARD WILL BE MODERATE**Avalanche Hazard Forecast for Wednesday 30/03/2022****Avalanche Problems****Wind Slab****Forecast Snow Stability & Avalanche Hazard**

The old snowpack will be firm, icy and stable. New deposits will gradually develop in depth during the day, primarily in wind sheltered and isolated places on South-East to South-West aspects above 900 metres. Deposits will not become significant until later in the afternoon as accumulations of unstable snow deepen. Below 900 metres a light snow cover will be present on all aspects above glen level. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

Winds will be light to moderate strength North-East or Northerly. Freezing level at 600m overnight falling to 200m during the day. Light precipitation overnight but a gradual increase in intensity expected through the day.

Comments

Colder conditions, summit temps of minus 7 deg C in morning expected. Significantly the snowpack will refreeze and become very firm and icy, ice axe and crampons will be necessary for those unaware of snow hazards at this time of year. Care to avoid slips and falls will be important, run-outs are serious with boulders at the base of slopes awaiting!
