Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Sun 03/04/2022 TO 18:00HRS Mon 04/04/2022

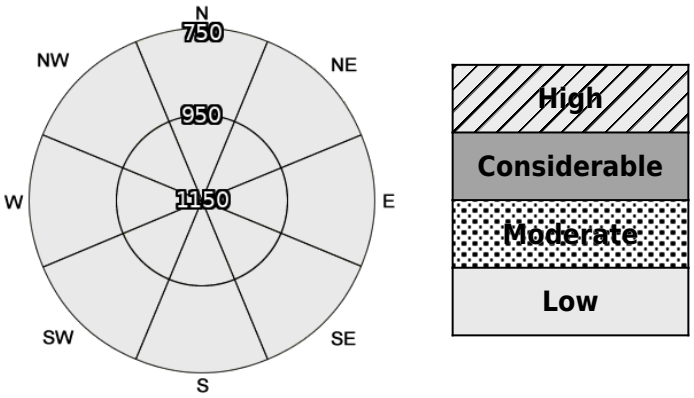

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Monday 04/04/2022

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Overnight thaw conditions will reduce the recent superficial cover of soft snow and start to soften surface layers of the older, well established snow-ice. Minor surface instabilities will be encountered in steep, wind sheltered locations on South-East to South-West aspects above 950 metres. Elsewhere the snow will be generally well bonded and stable. Greatest cover will exist in high North to East facing corries and on the highest plateau areas. The avalanche hazard will be Low.

Forecast Weather Influences

Very light precipitation throughout the forecast period, falling mainly as drizzle, but turning to sleet and then light snow on the highest summits only at the end of the afternoon. The freezing level will be above all summits overnight, eventually lowering to 1050 metres. Gale force Westerly winds overnight, veering North-Westerly and gradually easing through the day.

Comments

Complicated weather map for the next 48 hour period and beyond....Winter isn't over yet!
