

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 05/04/2022

Avalanche Problems

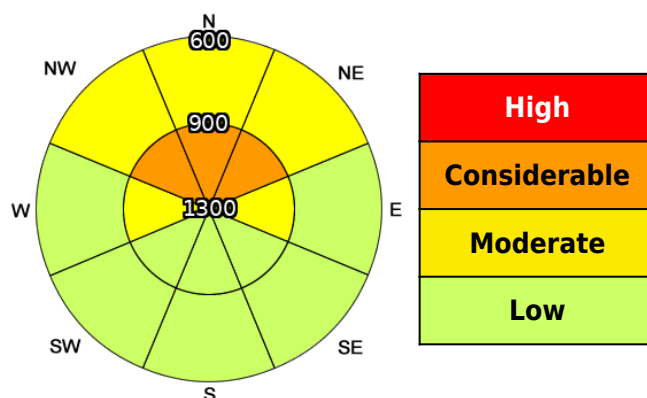

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

During the course of the day unstable windslab will develop and become widespread on North-West to North-East aspects above 900 metres. Areas most affected will be steep wind sheltered locations, in particular below coire rims, gully exits and crag aprons. Cross loading will affect West and East aspects. Developing cornices will be fragile. Localised unstable windslab will develop on these aspects below 900 metres on steep banks and shallow gullies. The avalanche hazard will be Considerable.

Forecast Weather Influences

Snow fall is expected above 600 metres throughout the forecast period. North-Westerly winds will be light to moderate overnight. During the day the winds will steadily increase moderate then strong, veering to become South-South-Easterly through the afternoon. During the night the freezing level will fall from 900 to 700 metres.

Comments

Unstable windslab expected to build through the day due to increasing wind speeds.
