

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 08/04/2022

Avalanche Problems

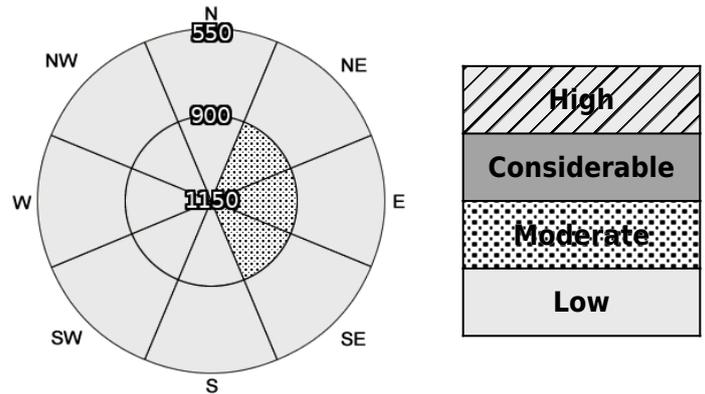

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Further shallow localised areas of moderately bonded windslab will continue develop in wind sheltered locations. North-East to South-Easterly aspects above 900 metres will be particularly affected with deepest accumulations in steep sheltered gullies, on scarp slopes and coire headwalls. New snow deposits will also develop on all other aspects but these are not expected to be deep or extensive. Fragile cornices will continue to develop on lee slopes. The avalanche hazard will be Moderate.

Forecast Weather Influences

Freezing level at around 500 metres. Light snow showers falling through the forecast period accompanied by fresh North-Westerly winds.

Comments

A cold arctic maritime airflow will continue to affect the area bringing a few isolated light snow showers. Fresh to strong North-West winds will gradually ease through Saturday as a ridge of high pressure builds from the West.
