

THE AVALANCHE HAZARD WILL BE CONSIDERABLE**Avalanche Hazard Forecast for Friday 30/12/2022****Avalanche Problems****Wind Slab****Wet Snow****Cornices****Forecast Snow Stability & Avalanche Hazard**

New snow and variable Southerly winds will form unstable windslab in sheltered gullies and on slopes with a North-West through North to Easterly aspect mainly above 850 metres, weakly bonded cornices will form above many of these areas. The older snowpack where exposed will remain firm and icy on higher slopes. The avalanche hazard will be Considerable.

**Forecast Weather Influences**

New snow will affect higher slopes overnight and through the day, heavier falls are expected overnight becoming lighter by dawn. Winds will be generally Southerly fresh to strong. The freezing level will be 500 metres overnight rising to 1300 metres by early morning and then lowering to 800 metres through the course of the day.

Comments

Freezing level expected to briefly rise above the summits in the morning before a return to cooler conditions later. Firm and icy conditions will exist on higher slopes with serious run out potential.
