

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 03/01/2023

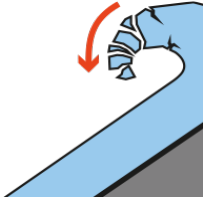

Avalanche Problems

Wind Slab

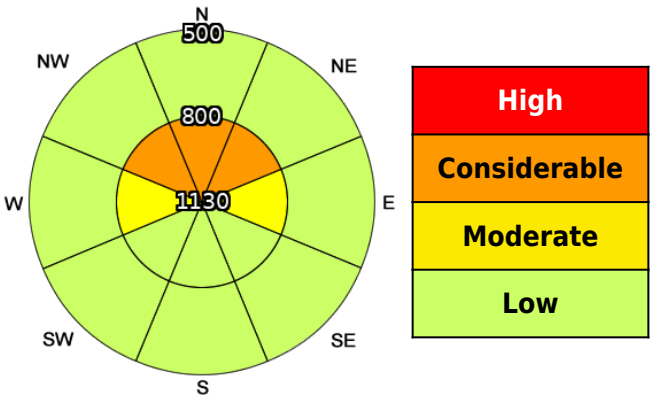

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Fresh unstable windslab will be deposited in wind sheltered areas overnight and during the morning, mainly on North-West to North-East aspects above 800 metres. West aspects will also be affected and older weaknesses will remain on East aspects. Instability will increase during the day as the freezing level rises and snow turns increasingly to rain at all levels. Cornices will be prone to collapse. The avalanche hazard will be Considerable.

Forecast Weather Influences

Winds will be generally South-South-Easterly, moderate during the evening then increasing strong overnight before easing moderate again during the day. The freezing level will be around 500 metres overnight, gradually rising during the day to be above the summits by early afternoon. It is expected to be dry overnight, then light snow at all levels from pre-dawn turning to rain at all levels by mid-afternoon.

Comments

Instability will increase throughout the forecast period.
