

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 10/01/2023

Avalanche Problems

Wind Slab

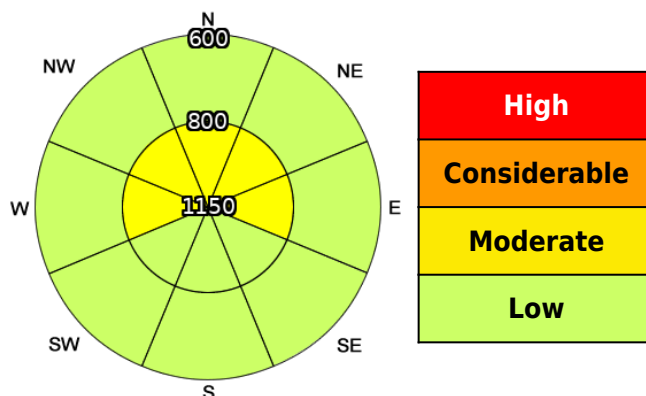

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

New windslab will develop, mainly above 800 metres in wind sheltered locations on North-West to North-East aspects. West and East aspects will also be affected by localised new accumulations. As the freezing level rises, new accumulations will become increasingly unstable with wet snow instabilities developing in these same locations. Cornices will also become increasingly unstable. The avalanche hazard will be Moderate.

Forecast Weather Influences

The freezing level will drop to around 600 metres overnight with snow showers arriving in the morning. As freezing levels rise in the afternoon to above the summits, snowfall will turn to rain at all levels. Winds will be moderate, Southerly first thing but quickly veering to the South-South-East for most of the day.

Comments

Very icy on the hills today (Monday). Tuesday will have a Wintery start but a mild and wet Afternoon.
