

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Monday 16/01/2023

Avalanche Problems

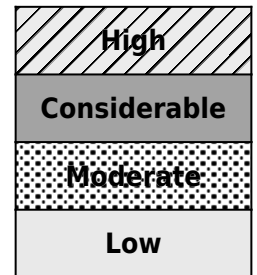

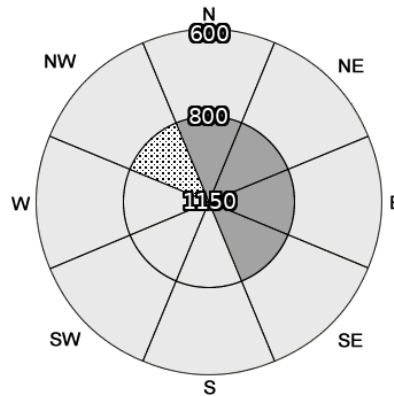

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Some consolidation of the snowpack is expected however, localised areas of poorly bonded windslab will persist. The greatest accumulations will be in steep wind sheltered locations mainly on N through E to SE aspects above 800 metres. NW aspects will also be affected due to cross loading. Sheltered gullies, scarp slopes and steep coire rims particularly affected. Fragile cornices will also persist. Wind affected slopes will often be firm and icy. The avalanche hazard will be Considerable.

Forecast Weather Influences

Remaining cold with the freezing level at around 200 metres. Staying predominantly dry although a chance of a light isolated snow shower but not significant snow amounts. The strong West-North-West winds will ease becoming Westerly through the day.

Comments

Icy in many wind scoured places. Remaining cold for next couple of days, possibly more snow arriving on Tuesday.
