

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 17/01/2023

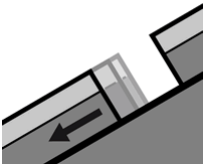

Avalanche Problems

Persistent Weak Layers

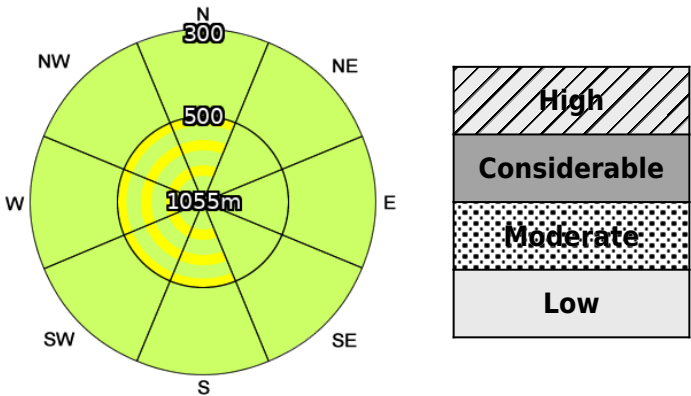

Cornices

Gliding Snow

Forecast Snow Stability & Avalanche Hazard

With continuing cold conditions in-depth weaknesses will persist where deeper windslab exists on steeper slopes. Areas most affected will be summit gullies and steep scarp slopes with a Northerly to Easterly aspect above 850 metres. Fresh windslab will form through the day on similar locations but amounts of new snow are not expected to be great. Windward slopes and areas clear of windslab will be mainly stable and will be icy in places. The avalanche hazard will be Considerable.

Forecast Weather Influences

It will remain cold with daytime freezing levels around 300 to 400 metres. Summit temperatures will be in the region of -6 to -8 Centigrade. Light snow showers will affect the area through the day. Winds will be fresh, generally from a Westerly direction.

Comments

Cold snowpack with in-depth weaknesses forming in recent windslab on steeper slopes. Cornices will remain prone to collapse.
