

## THE AVALANCHE HAZARD WILL BE MODERATE

### Avalanche Hazard Forecast for Monday 23/01/2023

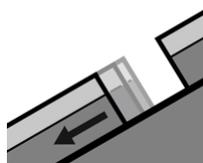

#### Avalanche Problems

Wet Snow

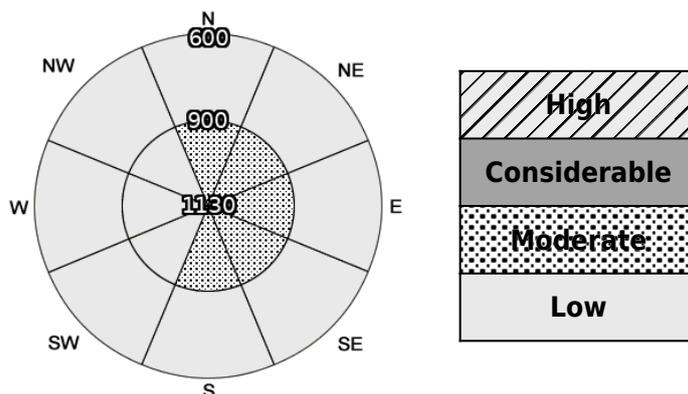

Cornices

Gliding Snow

#### Forecast Snow Stability & Avalanche Hazard

Consolidating snow in many places. Residual wet snow instability on steep N through E to S aspects above 900m. Weakening cornices above these locations will impose a large load on these slopes in the event of collapse. Minor full depth avalanches cannot be ruled out from steeply inclined benches and shelves on NE to E facing crags, many are loaded with deep snow. Falling ice a potential hazard in same locations. Better stability on less steep ground. The avalanche hazard will be Moderate.

#### Forecast Weather Influences

Remaining dry and mild.

#### Comments

Consolidating snow in many places but with some objective dangers from collapsing cornices and falling ice from crags.
