

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Sunday 29/01/2023

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Stable, well bonded snow throughout. Patchy snow below 900 metres but large areas will be encountered above this altitude, especially on North and East aspects. The avalanche hazard will be Low.

Forecast Weather Influences

Dry overnight. Very light rain during the middle of the day. There will be a trace of snow above 700 metres at the end of the period as the freezing level rapidly lowers from above the summits to around 800 metres. Light winds overnight will increase to become strong West-South-Westerly during the day.

Comments

Surface layers of the snow are extremely firm and icy.
