

**THE AVALANCHE HAZARD WILL BE CONSIDERABLE****Avalanche Hazard Forecast for Tuesday 31/01/2023****Avalanche Problems****Wind Slab****Cornices****Forecast Snow Stability & Avalanche Hazard**

The existing snowpack will be firm and icy in most areas giving high potential for serious uncontrolled slips on steeper slopes. New snow driven on by Westerly winds will form unstable windslab in wind sheltered locations, greatest accumulations will mainly be in sheltered gullies and on slopes with North-East to South-East aspect above 850 metres, other aspects may be affected by cross loading, Fresh cornices will be fragile. The avalanche hazard will be Considerable.

**Forecast Weather Influences**

Overnight the freezing level will briefly rise above the summits. A return to colder conditions will follow with the freezing level lowering to around 450 metres. Frequent snow showers which may be heavy at times and strong to gale Westerly winds will affect the area. A degree of uncertainty exist around new snow quantities.

**Comments**

Old snow is expected to be very firm and icy with serious run out potential in the event of an uncontrolled slip or fall. Crampons and ice axe are required for all snow travel.
