

## THE AVALANCHE HAZARD WILL BE LOW

### Avalanche Hazard Forecast for Friday 03/02/2023

#### Avalanche Problems

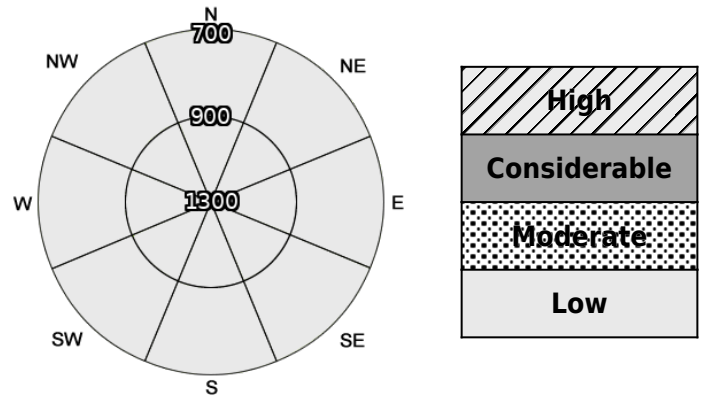

Wet Snow

Cornices

#### Forecast Snow Stability & Avalanche Hazard

The remaining snowpack will continue to consolidate and stability will be generally good. Any wet snow instabilities will be isolated and mainly in steep, high North through East to South-East aspects. Some cornices will remain on these same aspects and present a hazard as the freezing level rises. The avalanche hazard will be Low.

#### Forecast Weather Influences

Storm force West-South-West winds easing slightly overnight to Gale force during Friday. Rain showers clearing on Thursday evening followed by a dry day. The freezing level will remain around 1500 metres before lowering to 1000 meters, rising back to well above the summits by late morning.

#### Comments

Some seriously windy conditions. Still icy underfoot in places with potential for serious runouts into rocky terrain. Staying windy through Friday. Further thawing conditions expected Friday afternoon with potential for cornice collapse and rock fall.
