

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Sunday 19/02/2023

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The snowfall of the last 24 hours, primarily on Westerly aspects will rapidly consolidate, much of it melting as the temperature rises. Remaining old snow, primarily on North to East aspects above 800 metres will become moist but remain stable. The avalanche hazard will be Low.

Forecast Weather Influences

Light variable winds during the evening will become South-Westerly by midnight, then increase in strength to storm force by midday. Overnight it will be dry with the freezing level around 600 metres. Around dawn the freezing level will move above the highest summits and there will be precipitation falling initially as sleet before turning to rain at all levels.

Comments

The snow level rose rapidly up the mountains on aspects exposed to the morning sun.
