

### THE AVALANCHE HAZARD WILL BE LOW

#### Avalanche Hazard Forecast for Sunday 05/03/2023

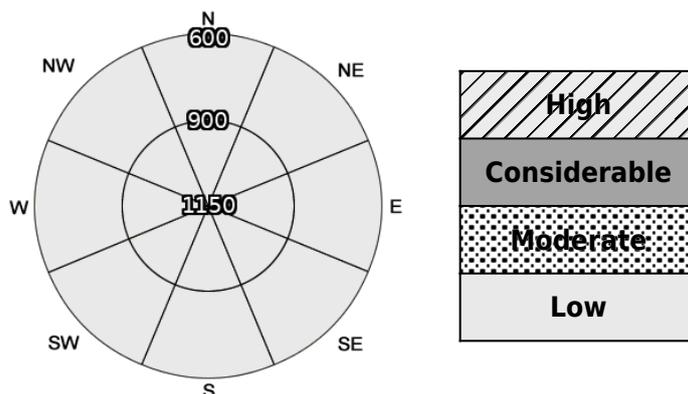

##### Avalanche Problems

Wind Slab

##### Forecast Snow Stability & Avalanche Hazard

A superficial dusting of snow will accumulate through the day in showers on most aspects. Isolated and avoidable deposits will achieve greater depth on East to South aspects above 1000 metres, where they will contain weaknesses in wind sheltered locations, such as coire rims. Outwith these areas the older snowpack is stable, firm and disguised by a cosmetic covering of new snow. The avalanche hazard will be Low.

##### Forecast Weather Influences

A generally dry day is expected with some snow showers falling above 700 metres. Snow amounts will be small with the greatest precipitation expected on the northern periphery of our area. Winds will be light to moderate in strength and mainly from the West-North-West veering to the North-North-West later. The freezing level will be at 600 metres rising to 800 metres later.

##### Comments

Greater snow amounts are expected in the main Cairngorm massif. Refer to the Northern Cairngorms avalanche report if visiting the northern periphery of our area.
