

### THE AVALANCHE HAZARD WILL BE MODERATE

#### Avalanche Hazard Forecast for Monday 06/03/2023

##### Avalanche Problems

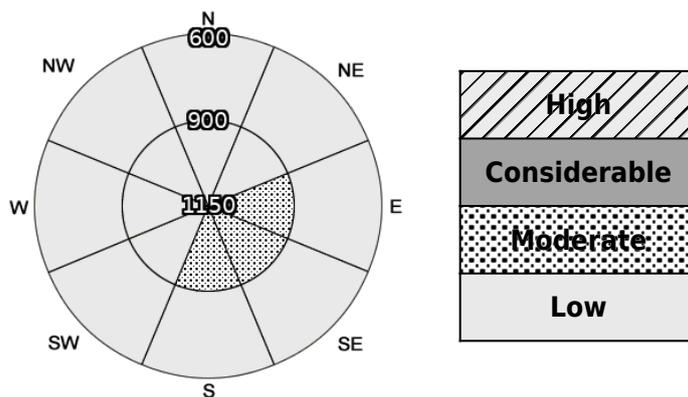

Wind Slab

Cornices

##### Forecast Snow Stability & Avalanche Hazard

Unstable windslab will progressively develop mostly on East to South aspects above 900 metres. Areas most affected will be steep wind sheltered locations, particularly where accumulations gain depth, such as coire rims and gully tops. Other aspects will be subject to crossloading. Outwith these areas the old snowpack will be generally stable, but firm and icy in wind exposed locations. The avalanche hazard will be Moderate.

##### Forecast Weather Influences

Showers are expected throughout the forecast period, initially falling as snow above 600 metres, but reaching all elevations by dawn. The north-east of our area is expected to see showers of greater frequency. Winds will gradually increase in strength to become strong by dawn, mainly North-North-Westerly. The freezing level will be around 600 metres overnight, lowering to 250 metres during daylight hours.

##### Comments

The north east of the Southern Cairngorms area is expected to see showers of the greatest frequency.
