

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Saturday 25/03/2023

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The old snowpack which remains limited to coire rims, back walls and in gullies, mostly above 950 metres on Northerly to Easterly aspects will refreeze, becoming firm and stable. New snow accumulations are not expected to be significant but a fresh covering of new snow will lie on mostly bare ground on South to South-Westerly aspects above 600 metres. The avalanche hazard will be Low

Forecast Weather Influences

Freezing levels will be at summit levels overnight lowering to 700 meters by daybreak. Precipitation falling as snow above 600 metres, mostly during the early hours with some light showers during the morning then dying out, leaving a dry day. Winds light to moderate in strength mostly Northerly to Easterly.

Comments

Greatest snow amounts in north of area at high elevations and on plateaus. Old snow frozen hard with serious runouts.
