

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 06/04/2023

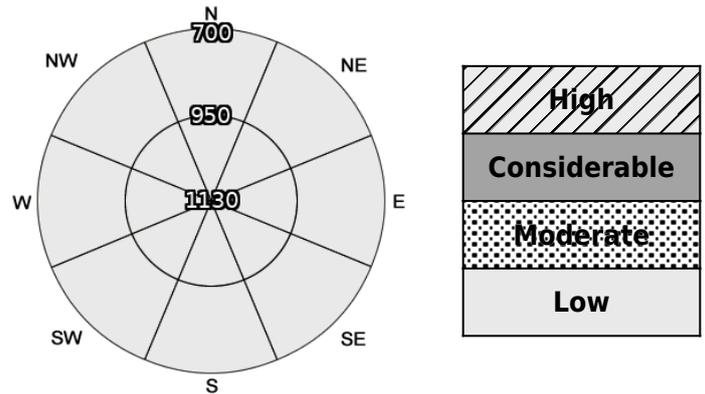

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

During the day some new windslab will be deposited in wind sheltered areas, mainly on East to South aspects above 950 metres. Accumulations gaining depth are not expected to be extensive. The old snowpack will be generally stable, and above around 900 metres its surface will start to refreeze and become firm. The avalanche hazard will be Low.

Forecast Weather Influences

Winds will be light generally West-South-Westerly overnight, strengthening and veering North-Westerly during the morning. Overnight the freezing level will be above all summits though gradually lowering; just before dawn it will drop to around 1000 metres. It is expected to be dry overnight, then some light showers through the day falling as snow above round 900 metres.

Comments

Main snow accumulations lie on North to East aspects above 850m, and on high plateaux.
