

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Monday 10/04/2023

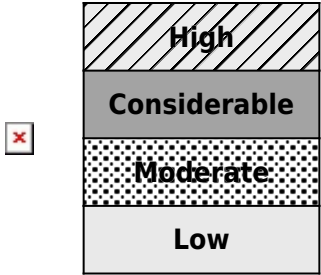

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

New snow amounts are not expected to be deep or extensive. Some shallow localised windslab may start to develop in wind sheltered locations mainly at the tops of sheltered gullies and on steep coire rims with a North to Easterly aspect above 950 metres. The older snowpack will consolidate and remain generally firm and well bonded. The avalanche hazard will be Low.

Forecast Weather Influences

Overnight, the freezing level will remain above the summits with rain at all levels along with strong South-South-Easterly winds. During the early morning the freezing level will lower to around 1000 metres, winds will ease becoming South-Westerly and precipitation will fall as sleet and snow mainly above 900 metres.

Comments

Getting cooler in the next couple of days with some summit snow and sleet.
