

### THE AVALANCHE HAZARD WILL BE CONSIDERABLE

#### Avalanche Hazard Forecast for Wednesday 12/04/2023

##### Avalanche Problems

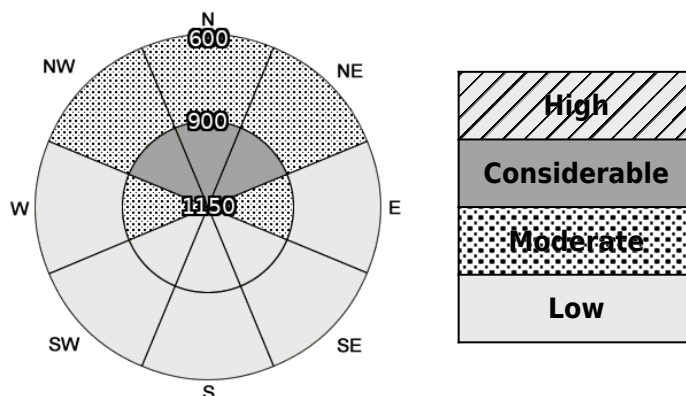

Wind Slab

Cornices

##### Forecast Snow Stability & Avalanche Hazard

New rapidly forming windslab will develop on North-West to North-East aspects with West and East aspects also affected by cross loading. Where new accumulations form over old snow-ice stability will be poor. Sheltered locations above 900 metres such as corrie rims and gully tops will be particularly affected. Unstable cornices also redeveloping above these locations. Deep drifts will be encountered from low levels. The avalanche hazard will be Considerable.

##### Forecast Weather Influences

Snowfall throughout this forecasted period, heaviest overnight easing slightly during the day. Falling initially above around 800 metres but settling to increasingly lower altitudes as the freezing level drops down to 500 metres. Winds will be strong throughout, East-South-East veering South-South-West, then backing to the South-East by the end of the period.

##### Comments

A return to Winter on Wednesday. Old snow patches will refreeze becoming icy again.
