

## THE AVALANCHE HAZARD WILL BE LOW

### Avalanche Hazard Forecast for Wednesday 10/01/2024

#### Avalanche Problems

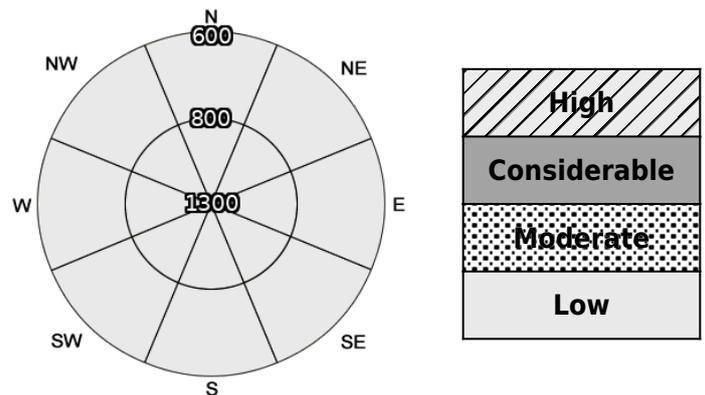

Wind Slab

Persistent Weak Layers

#### Forecast Snow Stability & Avalanche Hazard

Accumulations of moderately bonded windslab will persist overnight on Northerly aspects. During the day accumulations of poorly bonded windslab will start to build on South to West aspects above 800 metres as snow is redistributed. These accumulations will be shallow and avoidable. Areas most affected will be steep wind sheltered locations such as gully tops and coire rims. The avalanche hazard will be Low.

#### Forecast Weather Influences

A generally dry day is expected with a trace of snowfall late in the period. Winds will gradually back from South-Easterly to the North-East by dawn, and are expected to increase to strong by midday. The freezing level will fluctuate, but the snow surface will remain cold above 600-700 metres due to a stable airmass.

#### Comments

Windslab accumulations are isolated but poorly bonded, and may be consequential in steep or complex terrain.
