

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 11/01/2024

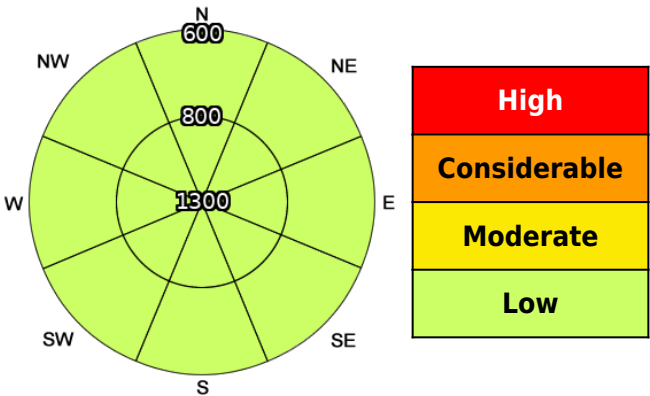

Avalanche Problems

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Accumulations of windslab will remain present on North-West to North-East aspects above 900 metres. Although moderate and poorly bonded these accumulations will be shallow and generally avoidable. Areas most affected will be gully exits, below coire rims and crag aprons. Elsewhere a widespread crust will overlie the old stable snowpack. The avalanche hazard will be Low.

Forecast Weather Influences

There is the potential for a few light snow flurries during the night but in the main it will be dry with a mix of cloud and sunshine during the day. Fresh North-Easterly winds will gradually ease moderate to light. Inversion conditions, with freezing levels potentially rising to above the summits during the afternoon; however the air mass over the Cairngorms will remain cool.

Comments

High pressure with inversion conditions continuing.
