

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 12/01/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change is expected in the snowpack, it will remain cold and generally stable throughout. A few instabilities will exist on very shallow and isolated patches of windslab which will exist on North-West to North-East aspects above 1000 metres. However, these will be very limited in extent. The avalanche hazard will be Low.

Forecast Weather Influences

It will remain dry and settled. South-Westerly winds will increase through the day. The freezing level will not be well defined, with various inversion layers. However, it will remain generally at or below freezing at most levels.

Comments

Water ice making some paths slippery.
