

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Sunday 21/01/2024

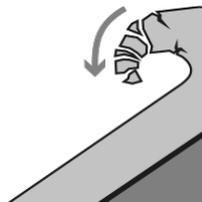

Avalanche Problems

Wind Slab

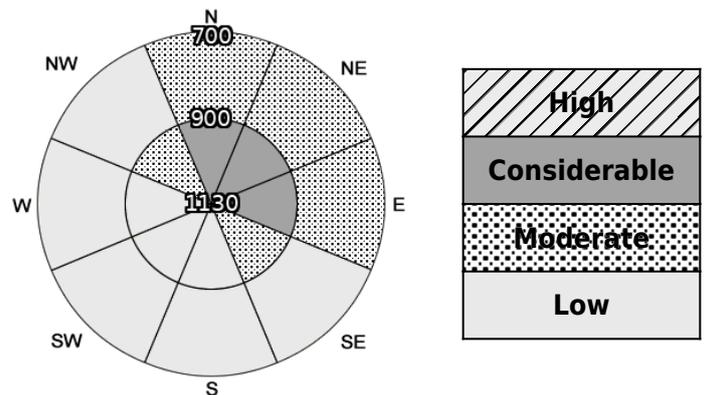

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Overnight, and in the morning, fresh unstable windslab will develop on steep North through to East aspects above 900 metres. Rapidly rising temperatures through the afternoon will create a period of high instability, both in this fresh windslab, and the underlying existing older snowpack, on these aspects. Cornices on these aspects will become increasingly unstable and prone to collapse. South through to West aspects will be generally scoured and stable. The avalanche hazard will be Considerable

Forecast Weather Influences

Overnight rain at all levels will turn to snow showers down to 600 metres during the day. This will change to heavy rain to all levels by late afternoon. Gale force South-Westerly winds will ease slowly overnight, then from dawn, will steadily increase to Gale force again, and back to Southerly by dusk, as storm Isha comes in. Overnight the freezing level falls to 600 metres, and then through the afternoon on Sunday, it will rise to well above the summits.

Comments

Rapidly rising temperatures on Sunday afternoon as storm Isha comes in will bring a period of high instability.
