

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 31/01/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Some new snow on the highest tops expected but will not be significant in depth. Old snow remnants will be firm and stable and confined to North to Easterly aspects above 800 metres. The avalanche hazard will be Low.

Forecast Weather Influences

South-Westerly winds will be very strong to storm force at summit levels overnight and during the day. Some showers, heavy at times will provide snow cover on the highest tops during Tuesday evening and overnight, then rain at all levels during the morning before snow showers return in late afternoon above 400 metres. Freezing level at 1000 metres overnight, then well above tops towards midday, then lowering to 600 metres during the afternoon.

Comments

Stormy Wednesday, with summit snows at times. Becoming more wintry at the weekend.
