

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 01/02/2024

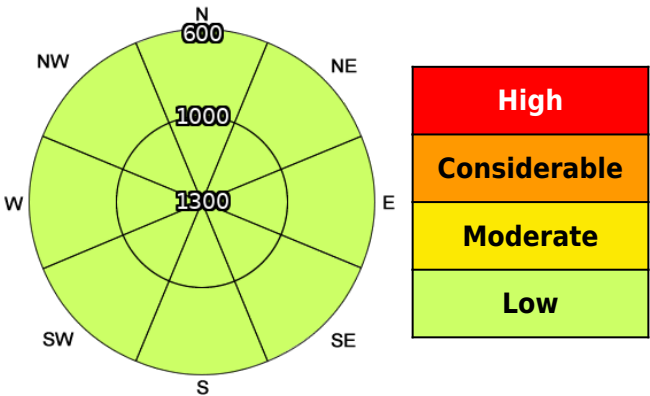

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

The snowpack will be stable, firm and continue to consolidate in most locations. As the day progresses the snow surface will soften below 900 metres. Moderately bonded and isolated windslab accumulations will be present on North-East to South-East aspects above 850 metres. These will be mostly confined to steep wind sheltered locations such as coire rims and convexities. The avalanche hazard will be Low.

Forecast Weather Influences

Snow is expected to fall in above 600 metres in the early evening followed by a dry night. Snow showers will resume above 900 metres late in the forecast period. Snow quantities are anticipated to be insignificant. Winds will be storm force Westerlies overnight, moderating to become very strong and from the West-South-West during the day. The freezing level will be around 900 metres at midday rising above the summits later.

Comments

Serious run out potential into rocks below on steep slopes.
