Avalanche Hazard Forecast

Issued 20/02/2024

FOR PERIOD 18:00HRS Tue 20/02/2024 TO 18:00HRS Wed 21/02/2024

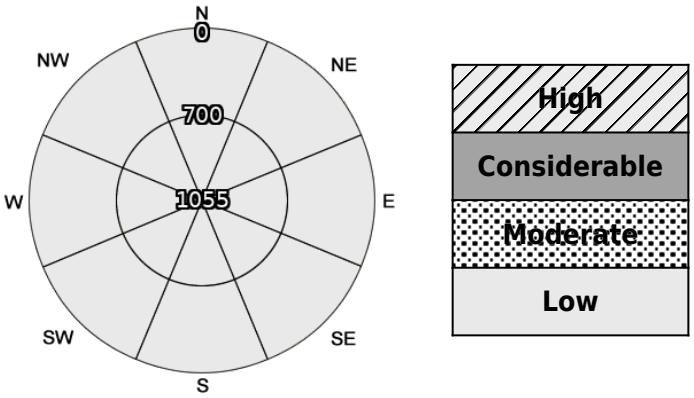

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 21/02/2024

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change expected. The patchy and moist snow cover will remain stable throughout with most snow lingering on high North to East aspects. A dusting of fresh snow is likely during the afternoon with most snow lying on wind sheltered Easterly aspects above 700 metres. At same time, the existing snow will re-freeze at summit levels. The avalanche hazard will be Low.

Forecast Weather Influences

Dry overnight before further rain at all levels arrives by daybreak, followed by wintry showers in the afternoon. The freezing level will rise well above the summits overnight, lowering to 600 metres through the afternoon. The strong, generally Westerly wind will back South for a time overnight, returning Westerly in the afternoon.

Comments

Forecast to be a tad colder for the remainder of the week allowing for a little fresh snow at higher elevations. Remaining windy.
