

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 27/02/2024

Avalanche Problems

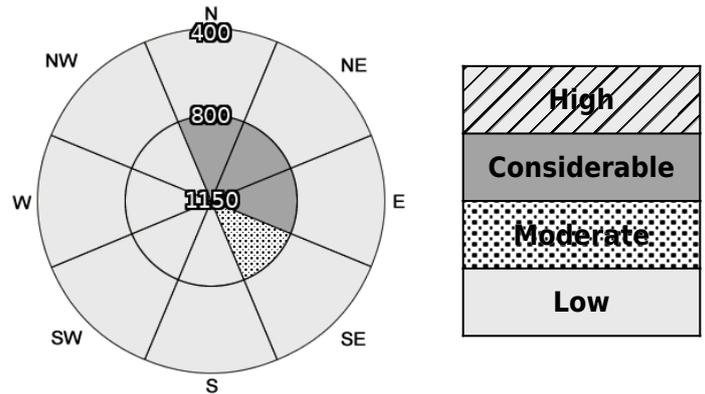

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Wind transport of new snow and existing snow will form areas of unstable windslab in wind sheltered locations. Greatest accumulations will be in sheltered summit gullies and Northerly to South-Easterly facing steep scarp slopes, mainly above 800 metres. Fragile cornices will exist above these aspects. The avalanche hazard will be Considerable.

Forecast Weather Influences

Snow showers overnight and through the day will affect slopes mainly above 800 metres. Winds will be strong to gale force generally South-Westerly overnight veering Westerly through the course of the day. The freezing level will briefly rise above the Glencoe summits early Tuesday morning lowering to 700 metres by evening. New snow amounts are uncertain but could be up to 10 centimetres if Tuesdays showers tend to merge.

Comments

Some doubt exists on new snow amounts. 10 cm possible if showers merge.
