

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 01/03/2024

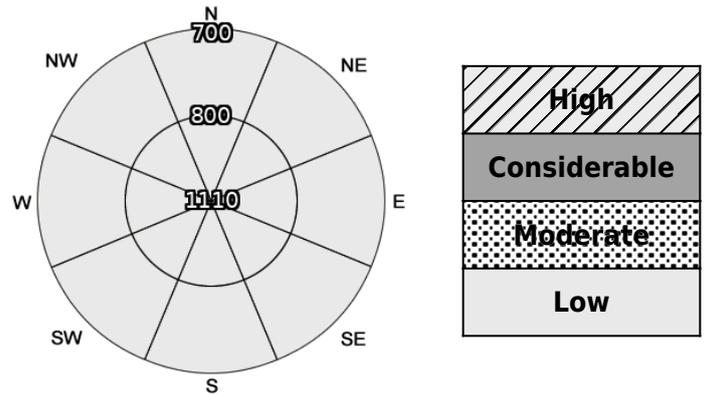

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

Isolated areas of unstable windslab will exist in steep wind sheltered locations, North to East aspects mainly above 800 metres, but will largely be avoidable. Further shallow pockets of windslab will develop through the afternoon on high, steep Southerly aspects above 750 metres, but again will be avoidable. Elsewhere, the older patchy snowpack will be stable and firm. The avalanche hazard will be Low.

Forecast Weather Influences

Wintry showers will peter out overnight, becoming part cloudy and dry for much of the day. Further snow expected through the afternoon. The South-Westerly gales will gradually moderate overnight, and back South, before freshening and veering North in the afternoon. The freezing level will dip to 400 metres overnight, rising to 600 metres through the day.

Comments

Possibility of a period of significant snowfall into the weekend through Saturday. Here's hoping - we need it.
