Cornices

Forecast Snow Stability & Avalanche Hazard

Localised accumulations on unstable windslab will persist on mainly North to East aspects above 850 metres. Deepest accumulations will be around coire rims, head walls, gullies and crag aprons. In the moderate to fresh winds, some redistributed windslab will begin to form on South-East to South-West aspects above 850 metres, though amounts are not expected to be deep or extensive. The old snowpack exposed to the wind will be frozen and generally stable. The avalanche hazard will be Moderate.

Forecast Weather Influences

Remaining dry throughout the period with moderate to strong winds from North-Easterly directions, later Easterly. The freezing level fluctuates between 400m overnight and 700m during the day.

Comments

Mainly dry through the weekend with further snow into next week.
