

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 13/03/2024

Avalanche Problems

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

A period of significant thaw overnight. During this period wet snow surface instabilities are possible on steep slopes and all remaining cornices will be prone to collapse. During daylight hours, remaining snow will start to become firmer in the drier colder conditions and stability will be good. Any new snow accumulations, as the temperature drops, are not expected to be significant. The avalanche hazard will be Low.

Forecast Weather Influences

Mild with heavy rain at all levels overnight, rain turning to snow above around 800 metres as precipitation clears to give a drier colder day. Gale force winds will be mainly South-Westerly. Daytime freezing level will be around 950 metres.

Comments

Strong winds on Wednesday are forecast to ease to give a calmer day on Thursday before milder conditons and rain return Thursday evening.
