

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 19/03/2024

Avalanche Problems

Persistent Weak Layers

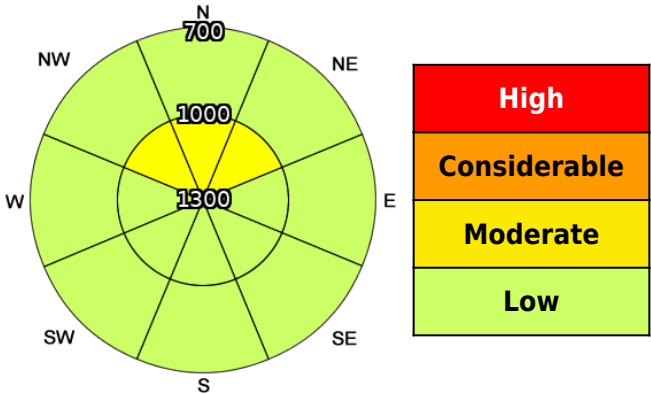

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Overnight, some wet snow instabilities will develop before the snowpack starts to slowly refreeze. Instabilites will linger within deeper accumulations on steep North-West to North-East aspects above 1000 metres. Areas affected will be coire rims, gully tops, crag aprons and convexities. Any remaining cornices found on the same aspects will be prone to collapse. Any new snowfall amounts will be insignificant. The avalanche hazard will be Moderate.

Forecast Weather Influences

After a very mild evening, the freezing level will lower to 1000 metres by midday. Overnight rain will clear to leave a mainly dry day with the exception of a few showers late morning, these falling as snow above 1000 metres. Winds, initially gale force Southerlies will ease becoming strong from the West.

Comments

The existing snowpack will continue to thaw and diminish in the mild temperatures, especially at lower elevations. As the freezing level lowers, the remaining snow will start to refreeze.
