

## THE AVALANCHE HAZARD WILL BE MODERATE

### Avalanche Hazard Forecast for Friday 05/04/2024

#### Avalanche Problems

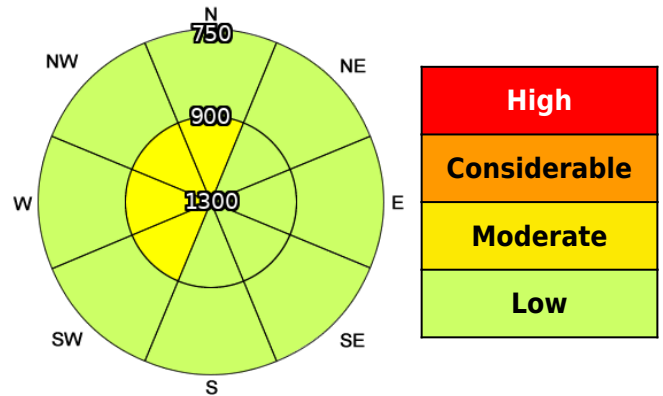

Wind Slab

Cornices

#### Forecast Snow Stability & Avalanche Hazard

New accumulations of unstable windslab will develop on South-West through West to Northerly aspects above 900 metres. Areas most affected will be in steep, wind sheltered locations such as below coire rims, the tops of gullies and crag aprons. As the freezing level rises all cornices will become increasingly unstable. The avalanche hazard will be Moderate.

#### Forecast Weather Influences

Snowfall from the middle of the night onwards. This will be heaviest during the early morning, then lighter and possibly turning to sleet towards summit levels through the afternoon. Fresh East-South-East winds will become gale force during the early morning before decreasing to strong through the day. The 600 metre freezing level will steadily rise to summit levels by the end of the forecast period.

#### Comments

Cornices will become increasingly unstable through the afternoon, potentially triggering slopes below.
