

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 09/04/2024

Avalanche Problems

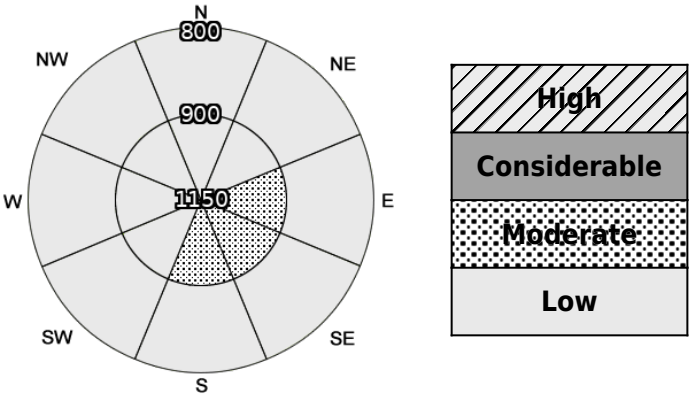

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Stability will generally remain good in most areas. Localised areas of windslab will form in wind sheltered locations, mainly around the tops of summit gullies and steep scarp slopes with an Easterly to Southerly aspect. These accumulations are not expected to be deep or extensive and in many areas will form on bare ground. Where they form on older snow, bonding will be poor. Cornices if they form will be fragile. The avalanche hazard will be Moderate.

Forecast Weather Influences

A strengthening, generally North-Westerly airflow will affect the area with new snow falling on slopes mainly above 800 metres. The freezing level will be around 800-900 metres. Winds 40-50 m.p.h. by end of the day.

Comments

New snow mainly overnight. Winds will become strong to gale by end of day.
