

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 11/04/2024

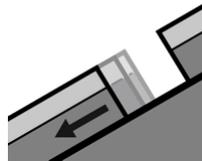

Avalanche Problems

Wet Snow

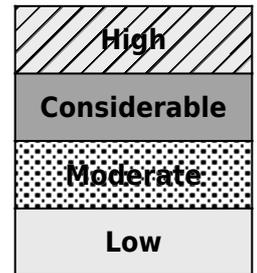

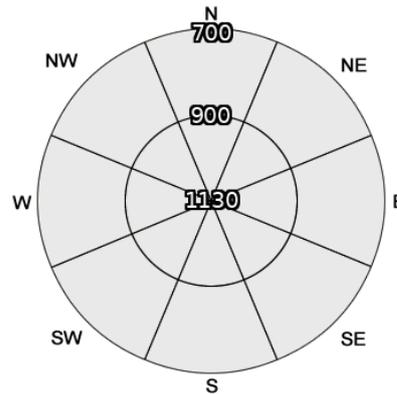

Cornices

Gliding Snow

Forecast Snow Stability & Avalanche Hazard

The snowpack will continue to thaw and become saturated at all elevations. Surface wet snow instabilities will be present on mainly North through East to South aspects above 900 meters. Areas most affected will be gully tops, scarp slopes and coire back walls. Any remaining cornices will be prone to collapse, and full depth avalanches on extremely steep slopes and crag ledges are possible. The avalanche hazard will be Low.

Forecast Weather Influences

The freezing level will continue to be above the summits. Rain will be heaviest during the evening, then ease overnight to leave a mainly dry day. Storm force South-Westerly winds overnight will become gale force during the day.

Comments

Continuing threat from rockfall in the thaw conditions. Looking colder into the weekend.
