

## THE AVALANCHE HAZARD WILL BE LOW

### Avalanche Hazard Forecast for Tuesday 17/12/2024

#### Avalanche Problems

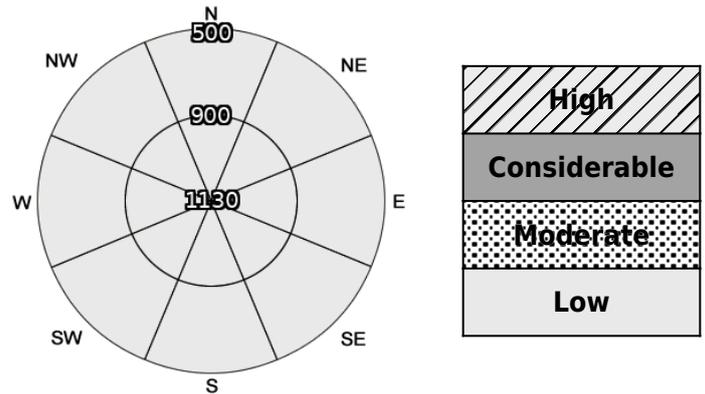

Wet Snow

Gliding Snow

#### Forecast Snow Stability & Avalanche Hazard

Little if any new snow expected to accumulate on steep North aspects above 1000m. Some residual wet instability will persist in old snow mainly on South-East to South aspects above 850m. Elsewhere, the much reduced patchy snowpack will be wet but generally well stabilised. The avalanche hazard will be Low.

#### Forecast Weather Influences

Light persistent rain overnight and during the day turning to sleet briefly over summits for a time in the morning. Strong West-South-West winds becoming Southerly after dawn. Generally mild with a brief cooler interlude in the morning.

#### Comments

Much reduced snowpack. Some minor wet snow instability, and or full depth potential, on SE to S aspects above 850m.
