

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Monday 30/12/2024

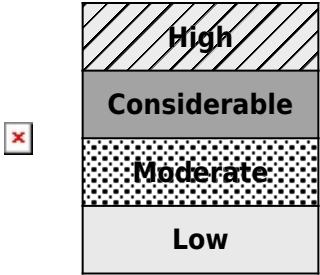

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

During the day, development of isolated pockets of unstable windslab is possible, affecting steep terrain, mainly South to South-West aspects above 750 metres. Northerly aspects may also be affected particularly on inland mountains. Locations most affected will be gully tops, coire rims and below ridge crests. Otherwise, accumulations of new snow will generally be small. The avalanche hazard will be Low.

Forecast Weather Influences

Summit rain, sleet and snow overnight and early morning, followed by drier, colder conditions. However, any fresh snow will thaw as the freezing level rises well above the summits overnight. A dusting of snow is possible during the afternoon as the freezing level lowers to around 600 metres. Westerly gales will ease to light North overnight, before Southerly gales early morning, becoming moderate North daytime.

Comments

Greatest accumulations of new snow will be on the more inland mountains. However, if colder air drifts south earlier in the forecast period, the coastal mountains will likely see more fresh snow.
